

OPERATING MANUAL

TAQINOR OS

Every module, how it works, how it all chains together — and exactly what you should do in it.

The multi-tenant ERP that runs your solar business end to end: leads → quotes → orders → invoices → installation → after-sales — on one connected record.

Prepared 20 June 2026 · Version 1 · Source of truth: docs/CODEMAP.md

How to use this guide

This is your operating manual — not a technical spec. It is written for you (the founder) and your team, so it tells you what each part of TAQINOR OS is for, how it connects to everything else, and the concrete actions you should take. Read Sections 1–3 once to understand the whole system; then keep Section 4 (the modules) and Section 6 (your daily rhythm) as a reference.

Throughout, look for these markers:

CHAINED TO

where the data comes from and where it flows next

WHAT YOU DO

the concrete actions for you and your team in that screen

Contents

1. The big picture — what TAQINOR OS is
2. The golden thread — how everything chains together
3. Roles, login & who does what
4. The modules, one by one
CRM · Sales (Ventes) · Quote Generator & PDFs · Stock ·
Installations · Field tools · After-sales (SAV) · Reporting ·
Settings · Notifications & Automation · AI · API · Imports
5. The rules you must never break
6. Your operating rhythm — daily, weekly, monthly
7. What protects you — safety, tenancy, audit
8. Quick reference — screen map

1

The big picture

TAQINOR OS is the single system that runs your solar installation business. One customer record travels the whole journey: a prospect becomes a lead, the lead gets a quote, the quote is signed and becomes an order, the order is invoiced and paid, the job is installed on site, the installed equipment is tracked under warranty, and any later problem becomes an after-sales ticket. Nothing is re-typed between stages — each module hands its data to the next.

Under the hood it is a web application you open in a browser. You don't install anything: your team logs in and works. A few facts that shape how you should think about it:

- **It is multi-tenant.** Every piece of data belongs to your company and is invisible to any other company on the platform. You never set this — the system stamps your company on everything automatically.
- **Everything is one connected chain.** The same client, quote and job are linked, so a number you enter once (a price, a power rating, a serial number) is reused everywhere downstream.
- **It is bilingual and Moroccan-first.** Screens are in French, WhatsApp messages can go out in French or Darija, amounts are in MAD, and Moroccan legal IDs (ICE, IF, RC, patente, CNSS) live on your company profile and flow onto documents.
- **It is safe by design.** Every change is logged, the live system can be rolled back if a release breaks something, and sensitive numbers (your buy prices, margins, costs) are never shown on anything a client sees.

THE ONE IDEA TO REMEMBER

- Think of TAQINOR OS as one long conveyor belt. Your job is to keep records moving along it — never to keep two parallel copies of the same thing in a spreadsheet on the side.
- When something looks wrong, the fastest fix is almost always upstream: correct the lead or the quote, and the corrected value flows forward.

2

The golden thread — how everything chains together

This is the most important page in the guide. Every module exists to move a record one step further along this thread. Learn it once and the whole system makes sense.

① LEAD	A prospect is captured (typed in, imported, or pushed from the website). It carries the contact, the energy profile (bills), the roof/site, and a pipeline stage : Nouveau → Contacté → Devis envoyé → Relance → Signé (or Froid).
② QUOTE (Devis)	You build a quote for the lead. The client is created automatically from the lead — you never duplicate it. The quote walks brouillon → envoyé → accepté . Accepting it is the moment the lead becomes Signé .
③ ORDER (Bon de commande)	The accepted quote becomes a client order. Marking it livré automatically takes the sold goods out of stock.
④ INVOICE (Facture)	From the quote/order you raise invoices — deposit, intermediate, balance, or full. Payments and credit notes attach here; the system tracks exactly what is still owed and chases it with relances.
⑤ INSTALLATION (Chantier)	Once signed, the job becomes a chantier. It freezes the bill of materials from the quote, reserves that stock, schedules field interventions, and runs a checklist on site.
⑥ EQUIPMENT	During the on-site checklist, serial numbers are captured. Each becomes a tracked piece of equipment with its own warranty clock , linked back to the installation and the product.
⑦ AFTER-SALES (Ticket)	Any later issue opens a ticket against that equipment/installation. The system already knows whether it is still under warranty.

KEEP THESE TWO LAYERS SEPARATE

- Two things ride **alongside** this thread but never merge into it: the pipeline **stage** (Nouveau...Signé — a sales funnel layer) and the document **statuses** (a quote being brouillon/accepté, an invoice being payée...). They are separate on purpose — a lead's funnel position is not the same as a document's state.
- “Perdu” (lost) is a flag you can set from *any* stage with a reason — it is not itself a stage.

3

Roles, login & who does what

Everyone logs in at the same address with their own account. What each person sees and can do is decided by their **role**. The menu itself shrinks or grows to match — a technician simply won't see the screens they don't need.

The seven standard roles

Directeur	Full access incl. margins, costs, commissions and the activity journal. This is your seat.
Administrateur	Manages users, roles and company settings; full operational access.
Commercial responsable	Sales lead — sees and reassigns the whole sales team's leads, quotes and invoices.
Commercial	Works their own leads and quotes.
Technicien responsable	Field lead — sees and assigns all chantiers, interventions and SAV tickets.
Technicien	Works their own assigned jobs and tickets.
Viewer	Read-only — can look, cannot change.

Roles can also be scoped to a **team**: if you set a person's supervisor, a responsable sees their whole sub-team's records while each person still sees their own. You can also create custom roles with exactly the permissions you want.

WHAT YOU DO — SET UP YOUR TEAM FIRST

- Set up people **before** you start working: Admin → Utilisateurs adds each teammate and assigns a role; Admin → Rôles lets you fine-tune permissions or build a custom role.
- Give yourself **Directeur**. Give Meryem and any office staff **Administrateur** or **Commercial responsable**. Give field staff **Technicien**. Reassign as the team grows — never share one login.
- Buy prices, margins and commissions are visible **only** to roles you grant it to (Directeur by default). Keep it that way.

4

The modules, one by one

Each module below follows the same shape: what it is, how it works, what it is chained to, and what you should do in it. They are in the order of the golden thread, so reading top to bottom walks a job from first contact to after-sales.

MODULE 4.1

CRM — Leads & Clients

In the app: **Menu “CRM” · /crm · /crm/leads**

Where every customer relationship begins and lives.

The CRM holds two things: **Clients** (the people/companies you do business with) and **Leads** (live sales opportunities). A lead is a rich solar record — contact (incl. WhatsApp & GPS), the energy profile (winter/summer bills, the 82-21 regularisation flag), the roof and site, a light survey, plus pipeline fields: owner, channel, priority, tags, next-follow-up date, installation type and — if lost — the reason. Every lead carries a **stage** on the funnel (Nouveau → Contacté → Devis envoyé → Relance → Signé, or Froid).

Leads come in three ways: typed in by your team, bulk-imported, or pushed automatically from your website form. Every lead has an Odoo-style **chatter**: it logs field changes by itself and lets you add manual notes — who did what is always recorded. You can view leads as a kanban board, a list, a calendar or charts, detect & merge duplicates, and archive (reversibly) the ones that go cold.

CHAINED TO Receives website leads automatically · feeds **Ventes** (a quote is built on a lead, and the client is resolved from it — never duplicated) · the moment a quote is accepted, the lead flips to **Signé** and the job is born in **Installations**.

WHAT YOU DO

- Capture every prospect as a lead the same day — a lead not in the system doesn't exist.
- Keep the **stage** honest as the deal moves; set a **relance date** so the system reminds you to follow up.
- Fill the energy profile (bills, summer-different toggle, 82-21) — those numbers pre-fill the quote and the solar sizing, saving you re-entry.
- When you lose one, mark it **Perdu** with a reason, don't delete it — the reasons become your loss analytics.
- Use merge when the same prospect shows up twice; archive (not delete) the truly dead ones.

MODULE 4.2

Sales — Quotes, Orders, Invoices, Payments

In the app: **Menu “Ventes” · /ventes/devis · /ventes/bons-commande · /ventes/factures · /ventes/avoirs · /ventes/relances**

The money pipeline: from a priced quote to cash in the bank.

This is the largest module and it runs the full commercial lifecycle:

- **Devis (Quotes)** — built per lead, with a reference numbered per month, a market mode (résidentiel / industriel / agricole), an accepted option (with/without battery), the technical study, discount handling (with an approval threshold), and versioning. Statuses: brouillon → envoyé → accepté / refusé / expiré.
- **Bons de commande (Orders)** — an accepted quote becomes an order; marking it **livré** decrements stock.
- **Factures (Invoices)** — deposit / intermediate / balance / full. Each freezes its amounts (HT, TVA, TTC). The system computes **montant dû = TTC – paid – credit notes**.
- **Paielements** — record each payment (cash, transfer, cheque, card...).
- **Avoirs (Credit notes)** — issued against an invoice, they reduce what's owed.
- **Relances (Recovery)** — escalating follow-ups on unpaid invoices, plus an aged-balance view and client statements.

Quotes and invoices can be shared with the client by a secure tokenized link (for WhatsApp delivery, no login needed) that expires after 30 days and never exposes buy prices.

CHAINED TO Built from a **CRM** lead/client · prices its lines from the **Stock** catalogue · accepting a quote signs the **CRM** lead and lets you spin up an **Installation** · delivered orders move **Stock** · paid/owed totals feed **Reporting**.

WHAT YOU DO

- Always start a quote **from the lead** (CRM → lead → “devis”) so the client links correctly and you don't create duplicates.
- Never hand-build a client-facing quote PDF anywhere else — the only approved path is the quote generator and its “/proposal” PDF (next module). This keeps every quote consistent and keeps your buy prices off the page.
- When the client agrees, mark the quote **accepté** — that one click signs the lead and unlocks the order and the chantier.
- Invoice in stages (deposit → balance) and **record every payment** the day it lands, so the relances and aged-balance stay accurate.
- Let the system chase late payers (Relances) instead of doing it by hand.

MODULE 4.3

Quote Generator & Quote PDFs

In the app: `/ventes/devis/nouveau` · the “/proposal” PDF

Turns an energy profile into a correct, on-brand solar proposal.

The generator is the screen where a quote is actually created (`/ventes/devis/nouveau`). It does the solar math for you in three market modes:

- **Résidentiel** — the simulator behaviour (sizing from bills).
- **Industriel / Commercial** — a self-consumption study: self-consumption & coverage rates, savings, payback.
- **Agricole (pompage)** — pumping: you enter pump CV/type/voltage/HMT and desired flow; it sizes the panel array, matches the right VEICHI variateur, and computes m³/day — no battery or inverter.

It auto-fills products and prices from your catalogue, is 100% TTC, and will **never reject a number you type**.

From the list's PDF dialog you choose the format: a 3-page premium proposal, a 4-page version with the study, or a 1-page summary. Every PDF shows the full price chain (Sous-total HT → Remise → Total HT → TVA → Total TTC), a system summary, and rich product sheets — and **never** your buy prices or margins.

CHAINED TO Reads the **CRM** lead's energy profile to pre-fill · pulls products & prices from **Stock** · writes the quote into **Ventes** · the PDF is delivered to the client by secure link / WhatsApp.

WHAT YOU DO

- Use this screen for **every** new quote — it is the single approved way to produce a client quote PDF.
- Pick the market mode that matches the job; let the auto-fill do the sizing, then adjust lines/prices as needed.
- Choose the 1-page summary for a quick offer, the 3- or 4-page premium for a full proposal. The study page needs study data — fill it in the generator first.
- If a price-less pump shows “prix à renseigner”, price it in the catalogue before quoting it — the generator deliberately won't guess.

MODULE 4.4

Stock — Catalogue, Inventory & Suppliers

In the app: Menu “Stock” · `/stock` · `/stock/mouvements` · `/stock/bons-commande-fournisseur` · `/stock/ocr-import`

The product catalogue and the single source of truth for quantities.

Stock holds your **Produits** (each with a sell price, an internal buy price, quantity, alert threshold, category, supplier, and a commercial sheet — brand, description, warranty; pumps also carry their performance curve). Around them sit categories, brands, suppliers, per-supplier buy prices (for cheapest-sourcing), stock locations (depot + vans), and the procurement chain: **supplier purchase orders** (receiving them adds stock) and **supplier returns** (validating them removes stock).

Every quantity change is written as a **movement** (entry / exit / transfer / adjustment) — that ledger is the audit trail, so stock is never edited silently. The catalogue also shows **reserved vs available**: stock promised to a signed chantier is held back so you don't double-sell it. You can even import supplier deliveries by photo via OCR.

CHAINED TO Prices the lines on every **quote/invoice** · delivered orders & validated chantiers create **movements** here · signed jobs reserve stock via **Installations** · buy prices feed the admin-only margin view in **Reporting** (never a client document).

WHAT YOU DO

- Seed and maintain the catalogue first — correct sell prices, brands, descriptions and warranties make every quote and product sheet correct.
- Keep **buy prices** (prix d'achat) filled for the margin view, but trust the system: they are internal-only and never reach a client.
- Set an **alert threshold** per product so low-stock warnings fire before you run out on a job.
- Move stock through purchase orders and movements — never adjust a number by hand unless you're correcting a real count (use an “ajustement”, which is logged).

MODULE 4.5

Installations — Chantiers & Field Execution

In the app: **Menu “Chantiers” · /chantiers · /interventions · /ma-journee**

Where a signed deal becomes a real job on a real roof.

A **chantier** (installation project) is created from a signed quote (“créer depuis devis”). It links back to the quote, order, lead and client, and **freezes the bill of materials** from the quote so the job's materials can't drift. It walks a status from SIGNÉ → matériel commandé → planifié → en cours → installé → réceptionné → clôturé, and tracks the law 82-21 regulatory dossier.

Underneath sit **interventions** (site visits — pose, raccordement, mise en service, contrôle, dépannage) with their own kanban and their own status track, a per-chantier **checklist** (auto-chosen by market type) whose serial-capture steps register equipment, and a technician's “**Ma journée**” day view. When the chantier reaches INSTALLÉ, the reserved stock is consumed exactly once. Cancelling or closing releases any unused reservation.

CHAINED TO Born from a **Ventes** quote/order · reserves & then consumes **Stock** · its checklist creates **SAV** equipment records · produces field PDFs (PV de réception, bon de livraison, attestation) · progress feeds **Reporting**.

WHAT YOU DO

- Create the chantier from the quote the moment it's signed — that freezes the materials and reserves the stock.
- Keep the status moving as the job progresses; don't skip INSTALLÉ — it is what consumes stock and closes the loop.
- Plan interventions and assign technicians (or let the default installer take it); the team works it from “Ma journée”.
- Run the on-site checklist and **capture serial numbers** — that is what starts every warranty clock.
- Generate the PV de réception / attestation at handover, straight from the chantier.

MODULE 4.6

Field Tools (Outillage)

In the app: Menu “Chantiers” → /outillage · Settings → “Kits d'outillage”
 Your durable tools — tracked, never sold, never consumed.

Outillage tracks durable tooling (drills, ladders, meters...) completely separately from the sellable stock catalogue. Each tool has an asset tag, a serial number, a home location (a depot or a van), and a status (available / on intervention / in repair / lost). You can group tools into reusable **kits** (e.g. “pose structure”, “raccordement”, “mise en service”) so the right kit pre-selects for a given intervention type.

CHAINED TO Tools attach to **Installations** interventions via kits · stays out of **Stock** and off every client document — never sellable, never consumed.

WHAT YOU DO

- Register your durable tools once and assign each a home van/depot.
- Build a kit per intervention type so a crew grabs the right tools without thinking.
- Keep statuses current (in repair / lost) so you know what's actually available before dispatching a crew.

MODULE 4.7

After-Sales (SAV) — Equipment, Tickets, Contracts

In the app: Menu “SAV” · /equipements · /parc · /sav · /sav/contrats
 Warranty tracking and the support desk for installed systems.

SAV has three parts. **Équipements** is the registry of everything you installed — each item links to its product and its installation, carries a serial number and computed warranty end-dates, and a status (in service / replaced / out of service). **Tickets** are the support cases (corrective or preventive), each with a status (nouveau → planifié → en cours → résolu → clôturé), a priority, and an automatic **under-warranty** determination read from the linked equipment. Parts consumed on a ticket can decrement stock. **Contrats de maintenance** are recurring preventive contracts with renewal tracking.

CHAINED TO Equipment is created by the **Installations** checklist · warranty is computed from **Stock** product warranty + install date · tickets can consume **Stock** parts · SAV load & costs feed **Reporting**.

WHAT YOU DO

- Trust the equipment registry — because serials were captured on site, you already know what's installed and whether it's under warranty.
- Open a ticket for every customer issue; let the system tell you warranty status instead of digging through paperwork.
- Use maintenance contracts for recurring clients so renewals don't slip.
- Internal repair costs stay internal — they never appear on a client-facing report.

MODULE 4.8

Reporting, Dashboards & the Activity Journal

In the app: Menu “Rapports” · /reporting · /reporting/balance-agee · /journal
 Your cockpit — the numbers that tell you how the business is doing.

Reporting reads across every other module (it stores no data of its own) and presents it role-filtered: a **dashboard** with KPIs and charts, a **pipeline** funnel with weighted forecast, sales / stock / service reports (exportable to Excel), an **aged-balance** view, client statements, and admin-only insights — recurring revenue, **job-costing/margins** (using internal buy prices) and **commissions**. A separate **Journal** is the activity log: who did what, when — every create/update/delete/login, bucketed by hour and day. It is visible only to roles you grant the journal permission (Directeur by default).

CHAINED TO Aggregates **CRM, Ventes, Stock, Installations** and **SAV** · margins read internal **Stock** buy prices · the Journal records actions from every module.

WHAT YOU DO

- Open the dashboard each morning — it's the fastest read on pipeline, cash owed and jobs in flight.
- Watch the **aged balance** weekly to catch slow payers early.
- Use job-costing to see real margins per job (only you and admins see this) and commissions to settle sales pay.
- Use the Journal when you need to know exactly who changed something.

MODULE 4.9

Settings — Company, Templates, Statuses, Users & Roles

In the app: Menu “Paramètres” · /parametres · /admin/users · /admin/roles

The control room — set this up once, the whole system follows.

Paramètres is where you configure the company so everything downstream is correct: legal identity and Moroccan IDs (ICE, IF, RC, patente, CNSS, RIB), branding (logo, signature, brand colour), default lead owner and default installer, and the quote-engine knobs — payment terms, validity days, VAT rates, ROI constants, max discount and the discount-approval threshold, agricole pump hours. You also manage **WhatsApp message templates** (French + Darija for devis / facture / relance), per-company **status labels**, **custom fields** (extra fields on leads, clients, products with no developer needed), commission mode, the referral program, and toggles like the silent DGI export. Every settings change is itself audited. **Users** and **Roles** are managed in the admin screens.

CHAINED TO Feeds identity & terms onto every **Ventes** document · templates drive **WhatsApp** delivery · roles gate what every module shows · custom fields appear in **CRM** and **Stock**.

WHAT YOU DO

- Do this first: fill the company profile (legal IDs, RIB, logo, signature) — these print on quotes and invoices.
- Set your VAT rates, payment terms, validity, max discount and approval threshold so quotes are correct and discounts need your sign-off above the limit.
- Edit the WhatsApp templates in your own words (FR + Darija).
- Add custom fields when you need to track something extra — no code, no waiting.

MODULE 4.10

Notifications & Automation

In the app: Header bell · /parametres/notifications · Settings → “Automatisations”

The system nudging you, and doing repetitive steps for you.

Notifications surface important events — a lead assigned to you, a quote accepted, a job to plan, an invoice overdue — in an in-app bell, and optionally by WhatsApp, email or web push. Each person tunes which events reach them and on which channel. Daily/weekly digests can summarise the day's work. **Automation** is a no-code rules engine: “when X happens, do Y” (with an optional owner-approval step), every run logged. It's opt-in and best-effort — it never blocks the action that triggered it.

CHAINED TO Listens to events across **CRM/Ventes/Installations/SAV** · sends via the same **WhatsApp/email** channels Settings configures.

WHAT YOU DO

- Set your notification preferences so the bell shows what matters to you and stays quiet on what doesn't.
- Turn on the daily/weekly digest for you and Meryem to start the day with a plan.
- Add automation rules cautiously, one at a time, and review their run log — keep an approval step on anything that touches money.

MODULE 4.11**AI Assistant — OCR & Ask-Your-Data**

In the app: Menu “IA” · /ia/ocr · /ia/agent

Read bills by photo, and ask your database in plain language.

Two AI tools, both login-protected and only active when their API keys are set. **OCR** reads a photographed bill or invoice and turns it into structured data (useful for capturing a prospect's electricity bill or a supplier delivery). The **Agent** answers questions about your own data in natural language — it writes a read-only query, scoped strictly to your company, and shows you the answer. It can only read, never change anything, and never exposes buy prices/margins.

CHAINED TO OCR feeds **CRM** energy profiles and **Stock** receptions · the Agent reads (read-only) across all your modules, company-scoped.

WHAT YOU DO

- Use OCR to capture bills instead of typing them.
- Ask the Agent things like “how many quotes are awaiting acceptance?” instead of building a report — it's faster for ad-hoc questions.
- These need API keys configured; if a screen says it's unavailable, the key isn't set yet.

MODULE 4.12**Connections — Public API, Webhooks, Monitoring & Imports**

In the app: Settings → “API & Webhooks” · /production · /stock/ocr-import · imports

How TAQINOR OS talks to the outside world and ingests bulk data.

A read-only **public API** (scoped API keys, company-limited, never buy prices) and **webhooks** (signed notifications on lead.created, devis.accepted, chantier.completed, facture.paid) let other tools integrate — for example your website pushing leads in. **Monitoring** can record system production yields and raise an under-performance flag (optionally auto-opening a SAV ticket). **Imports** bring in leads, clients or products from CSV/XLSX in a safe two-step way: a dry-run preview, then a create-only commit that skips duplicates.

CHAINED TO Website → **CRM** leads via webhook · API exposes **CRM/Ventes/Installations** read-only · Monitoring under-performance → **SAV** ticket · Imports populate **CRM** and **Stock**.

WHAT YOU DO

- Use the two-step import to load existing leads/clients/products — always review the dry-run before committing.
- Issue an API key only when a real integration needs it; each is scoped and revocable.
- Webhook secrets are set by you in the dashboard — treat them like passwords.

5

The rules you must never break

These are the founder's standing rules baked into the system. They protect your money, your data and your reputation. Keep to them and the system keeps its guarantees.

- **One quote-PDF path only.** Client quote PDFs come **only** from the quote generator and its “/proposal” engine. Never build a quote PDF by any other route — that's how buy prices stay off the page and every quote stays consistent.
- **Buy prices are never client-facing.** Your purchase prices, margins, costs and commissions appear only on internal, admin-only screens — never on any quote, invoice or document a client receives. The system enforces this; don't try to work around it.
- **Pipeline stages are fixed.** The funnel stages (Nouveau, Contacté, Devis envoyé, Relance, Signé, Froid) are the canonical set. Don't invent or rename stages; if you need a change, it's a deliberate decision, not an ad-hoc one.
- **Campaigns are born paused.** Any advertising campaign created through the system starts **paused** — it never goes live automatically. You turn it on deliberately.
- **Accounting integration is API-only.** Any future accounting/Odoo integration writes only through the official API — never directly into a database. This keeps your books trustworthy.
- **Scraping is gated.** Any data scraping never runs from personal accounts and requires a written risk note plus your explicit approval before the first run.

IN PRACTICE

- You don't have to police most of this by hand — the software enforces it. The one habit that's on you: always quote through the generator, and never keep a side-spreadsheet of prices or stages that competes with the system.

6

Your operating rhythm

A simple cadence keeps the conveyor belt moving and the data trustworthy. Adapt it to your team, but keep the shape.

EACH DAY

- Open the **dashboard** — read pipeline, cash owed, jobs in flight.
- Capture every new prospect as a **lead**; reply to the bell's notifications.
- Move quotes forward; mark accepted ones **accepté** (this signs the lead).
- Record every **payment** received today.
- Technicians work their day from "**Ma journée**" and update intervention status + checklists on site.

EACH WEEK

- Review the **pipeline** and chase leads with a due relance.
- Check the **aged balance** and let relances chase late invoices.
- Review open **chantiers** and **SAV tickets**; reassign as needed.
- Check **low-stock** alerts and raise supplier purchase orders.

EACH MONTH

- Review **margins (job-costing)** and **commissions**.
- Reconcile stock counts (logged adjustments only).
- Review loss reasons (Perdu) and conversion — tune your sales motion.
- Confirm company settings, VAT and templates are still right; add users/roles as the team changes.

7

What protects you

- **Your data is isolated.** Everything is stamped with your company and invisible to anyone else on the platform — automatically, on every record.
- **Everything is audited.** The Journal records who did what and when across all modules; settings changes are logged separately.
- **Releases are reversible.** The live system can be rolled back to its previous state if an update ever misbehaves — nothing is one-way.
- **Sensitive numbers are walled off.** Buy prices, margins, costs and commissions are visible only to the roles you allow and never leak onto client documents.
- **Numbering can't collide.** Quote and invoice references are assigned safely even under load, so two documents never share a number.
- **Quotes never lose your data.** The generator never rejects a typed number, and inbound website leads are always captured raw even before they're processed.

WHY THIS MATTERS TO YOU

- Because of all this, the right instinct when something looks off is to **fix it in the system** (correct the lead/quote/stock and let it flow forward), not to patch around it in a spreadsheet. The system remembers; the spreadsheet drifts.

8

Quick reference — screen map

The main screens and what you go there to do.

Module	Screen	Go there to...
CRM	/crm/leads	Capture & work leads; keep stages and relances current
CRM	/crm	Client records
Ventes	/ventes/devis/nouveau	Create a quote (the only quote path)
Ventes	/ventes/devis	Quote list; generate PDFs; accept quotes
Ventes	/ventes/bons-commande	Orders; mark delivered (moves stock)
Ventes	/ventes/factures	Invoices & payments
Ventes	/ventes/relances	Chase unpaid invoices
Chantiers	/chantiers	Installation projects; status & handover PDFs
Chantiers	/interventions	Site visits kanban; assign technicians
Chantiers	/ma-journee	Technician's day view (on site)
Chantiers	/outillage	Durable field tools
SAV	/equipements	Installed-equipment registry & warranty
SAV	/sav	Support tickets
SAV	/sav/contrats	Maintenance contracts
Stock	/stock	Product catalogue & quantities
Stock	/stock/bons-commande-fournisseur	Supplier purchase orders
Rapports	/reporting	Dashboard & KPIs
Rapports	/reporting/balance-agee	Aged balance (who owes what)
Journal	/journal	Activity log (who did what)
IA	/ia/ocr	Read a bill/invoice by photo
IA	/ia/agent	Ask your data in plain language
Paramètres	/parametres	Company profile, VAT, templates, settings
Admin	/admin/users	Add people & assign roles
Admin	/admin/roles	Define roles & permissions

This guide is a living document — it mirrors the system as built (docs/CODEMAP.md). When the product gains a module, regenerate it so the team always has an accurate map.
